Step 2

Python is free, open-source, and has a lot of helpful libraries for data analysis. It is capable of processing large amounts of data at once.

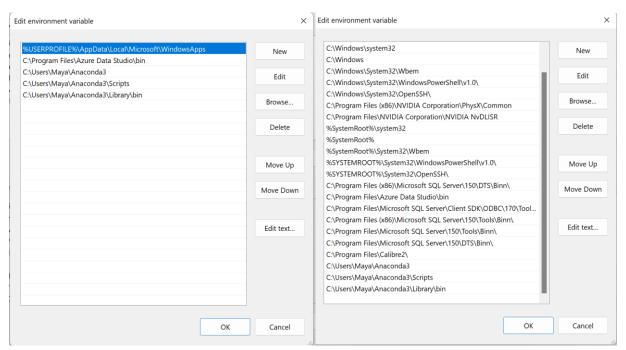

Step 3

- 1. Facebook
- 2. Instagram
- 3. Amazon
- 4. Quora
- 5. Netflix

Step 4

- You have a small data set that needs some quick tweaks and minor analysis. You'll need
 to filter some columns and make a quick chart. I would use excel, because it is easiest to
 make small, quick changes
- You need to retrieve some portion of data from a very large database. I would use SQL because it is used to interact with databases
- You have a data set with 15,000,000 rows and 350 columns that needs to be sorted and prepared for a more advanced analysis. I would use Python because it is well-suited for extremely large datasets

Step 6

Step 8
